Fumble Rewards Launchpad — Concept Overview

A Solana token launchpad that pays sellers back when a coin they sold later runs 10x.

10x	10% back	Per-coin pool	90 days
trigger over your sell price	of the tokens you sold	each coin funds its own	to claim after you sell

01 The problem

Selling too early ("fumbling") is the most common and most painful experience in memecoin trading. You take profit, or cut a loss, and then watch the coin run 10x, 50x, 100x without you.

Nothing softens that today. Existing "fumble" tools only measure how much you missed out on, which makes it hurt more. And the people who sold tend to become the coin's loudest critics.

02 The idea

A Solana launchpad, similar to Pump.fun, where every coin has fumble rewards built in.

- **Sell through the launchpad.** Your sell is recorded on-chain: amount, price and time.
- **If the coin later reaches 10x your sell price,** you can claim a flat **10% of the tokens you sold**, paid in that coin. Sold 1M, claim 100K.
- **Claiming is optional.** Claim at 10x, or wait. The token count is fixed, so if the coin keeps rising, the same claim is worth more.
- **Claims expire 90 days** after the sell.

WORKED EXAMPLE

You sell 1,000,000 tokens at $0.001	**$1,000**
The coin reaches $0.01 (10x your sell)	**claim opens**
You can claim 10% of 1,000,000	**100,000 tokens**
Value if you claim at 10x ($0.01)	**$1,000**
Value if you wait to 30x ($0.03)	**$3,000**
Not claimed within 90 days	**expires**

You sold a coin and it ran. Instead of a reminder of what you missed, you get a piece of it back.

At 10x, the claim is worth about what you sold for. It's a consolation prize paid in the coin, so a seller becomes a holder again, and often the coin's loudest promoter.

How a claim works

1 · Sell
through the launchpad, $50 or more
Sell is recorded on-chain

→

2 · Graduate
coin leaves the bonding curve
Claims open after this

→

3 · 10x
average price reaches 10x your sell
Time-averaged, not a spike

→

4 · Claim
10% of the tokens you sold
Paid from that coin's pool

You can claim any time the price is above 10x, up to 90 days after your sell. If the pool is short, you're queued in order of when you sold.

03 How it's funded

Each coin pays for its own rewards. There is no shared pot across coins and no promise the platform has to cover.

- **5% of each coin's supply** is reserved for that coin's reward pool at launch.
- **A 1% fee on every trade** made through the launchpad, before and after graduation, split three ways:

Example: a $10,000 trade pays a $100 fee. $50 buys that coin and adds it to its pool, $30 goes to the platform, and $20 goes to the coin's creator. The creator's share is always paid, whatever happens with claims.

WHY PAY IN TOKENS

Rewards are paid in the coin, from the coin's own pool. A claim can never be more than 10% of the tokens sold, and a pool can only pay out what it holds. The platform never takes on a debt it can't cover.

BUILT-IN BUY PRESSURE

Half of every fee is spent buying the coin itself. The more a coin trades, the more it gets bought, and the bigger its pool grows for future claims.

04 Mechanics

Bonding curve, like Pump.fun
Every coin starts on a fair-launch curve. No presale.

Graduates at ~85 SOL
Same threshold as Pump.fun. Liquidity moves to PumpSwap automatically.

Built-in swap after graduation
The launchpad routes trades for the best price. Only sells made through it count for rewards.

Claims open after graduation
Sells made on the curve count, but can only be claimed once the coin has graduated.

$50 minimum sell
Smaller sells still go through; they just don't earn a reward.

Instant payouts
If the pool has enough, the claim pays in the same transaction.

First come, first served
If a pool runs short, claims queue in order of sell time.

Capped per claim
A single claim can take at most 10% of the pool, so no one drains it.

10x is checked with a time-averaged price
A brief spike or a single big buy can't trigger claims. The price has to hold at 10x over time.

05 Why it's different

- **No launchpad rewards sellers.** Every competitor offers the same bonding curve. Nobody looks after the person who sold.
- **It turns regret into a game.** Traders already post their worst fumbles for laughs. Here a fumble becomes a trophy, and sometimes a payout.
- **Built-in buy pressure.** Half of every fee buys the coin, for every coin, from day one.
- **Payouts are public marketing.** Every claim is on-chain and shareable. Each one is a post that brings in the next trader.

06 The experience

- **Social feed** in the style of X: live sells, 10x crossings, graduations and claims as they happen.
- **Coin profile pages** with chart, curve progress, pool size and claim queue.
- **Claim dashboard:** every sell you made, how close it is to 10x, what you can claim and the days left.
- **Leaderboards, levels and achievements** for the biggest fumbles, top claimers and diamond hands.

07 Abuse protections and key risks

The obvious attack is **sell-and-rebuy farming**: sell, buy straight back, keep your position and collect a free reward ticket. The design limits it:

Rebuys cancel rewards	Buying the same coin back within 7 days shrinks the reward by the amount rebought, down to zero.
Minimum hold	You must have held for at least 10 minutes before a sell counts, which stops buy-then-dump farming.
Limits per wallet	$50 minimum per sell, and at most 5 open rewards per wallet per coin.
No creator claims	A coin's creator can't earn rewards on their own coin.
Flagging	Rebuys made elsewhere and linked-wallet clusters are flagged publicly and left off rankings.
Bounded damage	Payouts come only from the coin's pool, at most 10% per claim. Abuse can dilute a pool, not drain it.

Key risks, stated plainly:

Pump.fun's dominance	Pump.fun is the default launchpad and could copy the feature. After graduation, many traders will use other apps, and those trades earn no fees for the pool. The bet is that rewards give people a reason to trade here, to be measured in beta.
Legal framing	This is a reward, not insurance. Payouts aren't guaranteed and depend on the pool balance. Legal counsel before beta, restricted regions blocked, clear published terms.
Platform dependency	Relies on PumpSwap after graduation, which can change fees or rules. The design stays able to switch venues.
Smart-contract risk	Two independent audits, a bug bounty and multisig-controlled upgrades before mainnet.

08 Roadmap

Spec
Product and technical design drafted.

Contracts on devnet
Curve, pools, claims, graduation, swap.

App
Feed, coin pages, claim dashboard, game layer.

Audit and beta
Two audits, then an invite-only mainnet beta.

Launch
Open to everyone. Roughly 5–6 months from start.

This document describes a product concept in development. Parameters (10x trigger, 10% reward, fees, limits) may change after simulation, audits and legal review. Nothing here is financial advice or an offer of any token.
